

Executive Summary

Blinkit Sales Analysis Project

Project Objective

The primary objective of this project is to analyze Blinkit's sales data to identify key factors influencing sales performance across products, outlets, and locations. Through Exploratory Data Analysis (EDA), the study aims to uncover actionable insights that can help optimize outlet strategy, improve product assortment, and support data-driven business decisions for revenue growth.

Dataset Overview

The dataset contains sales-related information at the product and outlet level, including:

- Product attributes (Item Type, Item Fat Content, Item Visibility, Rating)
 - Outlet characteristics (Outlet Type, Outlet Size, Outlet Location Type)
 - Temporal attributes (Outlet Establishment Year, Outlet Age)
 - Target variable (Sales)
-

Key Findings & Insights

1. Overall Sales Distribution

Sales are unevenly distributed across products and outlets, with a small number of categories and outlet formats contributing a significant portion of total revenue.

Insight:

Revenue concentration indicates dependency on specific outlet types and product segments.

2. Outlet Type Impact

- Supermarket Type1 generates the highest total sales, significantly outperforming other outlet types.
- Grocery stores contribute comparatively lower sales.

Insight:

Outlet format plays a critical role in driving sales performance.

3. Outlet Size Analysis

- Medium-sized outlets contribute the highest total sales.
- Large outlets do not necessarily outperform medium outlets.

Insight:

An optimal balance between scale and efficiency exists in medium-sized outlets.

4. Outlet Location (Tier-wise Performance)

- Tier 3 locations contribute the largest share of total sales.
- Tier 2 and Tier 1 locations follow in descending order.

Insight:

Smaller and developing cities represent strong demand and growth opportunities.

5. Product Category (Item Type) Performance

Sales vary significantly across item categories, with a few product types dominating overall revenue.

Insight:

Product category selection has a greater impact on sales than visibility alone.

6. Rating & Customer Feedback

- Products with ratings around 4.0 generate the highest total sales.
- Ratings are largely concentrated between 3.5 and 4.5.

Insight:

Higher customer satisfaction is positively associated with higher sales performance.

7. Outlet Age Analysis

Sales performance varies across outlet age groups, indicating that outlet maturity influences revenue generation.

Insight:

Operational experience and customer base development improve performance over time.

Business Recommendations

- 1. Focus on Supermarket Type1 Expansion**
Prioritize this outlet format due to its consistent and dominant sales performance.
 - 2. Target Tier 3 Markets Strategically**
Increase investment and expansion in Tier 3 locations where demand is strongest.
 - 3. Optimize Medium-Sized Outlets**
Leverage medium-sized outlets as they deliver the highest sales efficiency.
 - 4. Strengthen High-Performing Product Categories**
Align inventory and promotions toward top-selling item types.
 - 5. Leverage Customer Ratings**
Improve product quality and customer experience to sustain high ratings and sales.
-

Conclusion

This analysis demonstrates that Blinkit's sales performance is strongly influenced by outlet type, outlet size, location tier, product category, and customer ratings. By focusing on high-performing outlet formats, expanding strategically in Tier 1 and 2 locations, and optimizing product assortment, the business can significantly improve overall revenue performance.

This project provides a strong data-driven foundation for strategic planning, operational optimization, and future predictive sales modeling.
